

Racial Profiling, Bad Cops, and Police Shootings

Greg Ridgeway

Department of Criminology

Department of Statistics

Outline

- Which officers are most likely to shoot?
- Do police target black drivers?
- Are there individual officers that appear to target minorities?

Outline

- Which officers are most likely to shoot?
- Do police target black drivers?
- Are there individual officers that appear to target minorities?

Confounding Chronically Hindered Connecting Officer Features and Risk

“the overrepresentation of minority officers among police shooters [is] closely associated with racially varying **pattern of assignment**, socialization, and residence”

Fyfe (1981)

Confounding Chronically Hindered Connecting Officer Features and Risk

“it is quite possible that other factors, such as the extent to which college-educated officers versus non-college-educated officers **encounter resistant suspects**, may account for why education appears to matter”

Paoline and Terrill (2007)

Confounding Chronically Hindered Connecting Officer Features and Risk

“based on an officer’s rank, time on the job, age, and gender, he or she may have been less active, assigned to **areas with lower crime rates**, or working in a position that did not have **frequent contact** with citizens”

McElvain and Kposowa (2008)

Officer Van Dyke Fired 16 Rounds Officer Walsh Holstered His Firearm

Model the Chance of Shooting

- Probability of shooting for an officer with features \mathbf{x} in an environment with features \mathbf{z}

$$\log \frac{P(\mathbf{x}, \mathbf{z})}{1 - P(\mathbf{x}, \mathbf{z})} = h(\mathbf{z}) + \beta' \mathbf{x}$$

- \mathbf{z} includes suspect features, time, place, ...
- $h(\mathbf{z})$ is a large negative number for almost all environments
- \mathbf{x} includes officer age, race, sex, prior involvement in shootings, complaints, awards, assignment, ...
- $\exp(\beta_j)$ indicates how much a unit change in x_j increases the odds of the officer shooting

Model the Number of Rounds Fired

- Probability of shooting r rounds for an officer with features \mathbf{x} in an environment with features \mathbf{z}

$$\log P(R = r) = r(h(\mathbf{z}) + \beta' \mathbf{x}) - e^{h(\mathbf{z}) + \beta' \mathbf{x}} - \log r!$$

- Poisson regression with shooting rate $e^{h(\mathbf{z}) + \beta' \mathbf{x}}$
- $\exp(\beta_j)$ indicates how much a unit change in x_j multiplies the expected rounds discharged

Traditional Logistic Regression Model Requires Complex Data Collection

- Collect data at random point in time for randomly selected officers
 - Record \mathbf{x}_i , the officer's features
 - Record \mathbf{z}_i , the environment features
 - Record $r_i = 1$ if officer i shot and 0 otherwise

Rounds	Years on job	Sex	Race	Prior OIS #	...	Time	Lighting	Armed suspect	...
0	4	Male	White	0		8pm	Sunny	No	
0	4	Male	White	0		3am	Sunny	No	
0	9	Female	Black	1		11am	Dark	No	
0	5	Male	Hispanic	0		10am	Dark	No	
0	1	Male	White	0		7pm	Inside	No	
...									
1	3	Female	White	1		6pm	Dark	No	
...									

r_i \mathbf{x}_i \mathbf{z}_i

Nuisance Parameter $h(\mathbf{z})$ Complicates Traditional Likelihood Analysis

- Collect data at random point in time for randomly selected officers
 - Record \mathbf{x}_i , the officer's features
 - Record \mathbf{z}_i , the environment features
 - Record $r_i = 1$ if officer i shot and 0 otherwise
- Traditional logistic regression would find β to maximize

$$P(R_1 = r_1, \dots, R_n = r_n | \mathbf{x}_1, \dots, \mathbf{x}_n, h(\mathbf{z}_1), \dots, h(\mathbf{z}_n), \beta)$$

1. A random sample would likely capture no shootings
2. Hard to completely document \mathbf{z}
3. $h(\mathbf{z})$ difficult to model

Condition on a Sufficient Statistic for Nuisance Parameter

- Consider one moment in time, one place in space
- Condition on the number of shooters

$$P(R_1 = r_1, \dots, R_n = r_n | R_1 + \dots + R_n = r_1 + \dots + r_n, \mathbf{x}_1, \dots, \mathbf{x}_n, h(\mathbf{z}), \beta)$$
$$= \frac{e^{r_1 \beta' \mathbf{x}_1} \dots e^{r_n \beta' \mathbf{x}_n}}{\sum_{\rho_i \in \{0,1\}, \sum \rho_i = \sum r_i} e^{\rho_1 \beta' \mathbf{x}_1} \dots e^{\rho_n \beta' \mathbf{x}_n}}$$

- Knowing or not knowing $h(\mathbf{z})$ produces the same $\hat{\beta}$
- Still yields consistent estimates for β (Manski & Lerman, 1977; Prentice & Pyke, 1979)

The only times and places that provide information about β through the conditional likelihood are multi-officer shootings

Conditional Likelihood Also Applies to the Number of Rounds

- For the number of round fired, the contribution of a shooting to the conditional likelihood is

$$\frac{e^{r_1\beta' \mathbf{x}_1} \dots e^{r_n\beta' \mathbf{x}_n}}{\sum_{\rho_i=\sum r_i} \frac{1}{\rho_1! \dots \rho_n!} e^{\rho_1\beta' \mathbf{x}_1} \dots e^{\rho_n\beta' \mathbf{x}_n}}$$

The only times and places that provide information about β through the conditional likelihood are multi-officer shootings

Five Officers Discharged 50 Rounds, Killing Sean Bell in 2006

- Detective Oliver, age 35, white, 31 rounds
- Detective Isnora, age 28, black, 11 rounds
- Detective Cooper, age 39, black, 4 rounds
- Officer Carey, age 26, white, 3 rounds
- Detective Headley, age 35, black, 1 round

Major Cities Chiefs (MCCA) and Police Foundation Standardized Collection

- 56 agencies from MCCA in the U.S. and Canada contributed to this data collection effort
- Full dataset describes 2,574 officers involved in 1,600 shootings between 2010-2018
- Analysis used all 317 multi-officer shootings, 849 officers, 5,026 rounds
- Only included data on officers who discharged their firearm

G. Ridgeway, B. Cave, and J. Grieco (under review). “A Conditional Likelihood Model of the Relationship Between Officer Features and Rounds Discharged in Police Shootings.”

Conditional Likelihood Truncated at $r_i > 0$ is Complex

$$-\sum_{s=1}^S \log \left(\sum_{\sum \rho_i = \sum r_{si}, \rho_i > 0} \prod_{i=1}^{n_s} \frac{1}{\rho_i!} \exp((\rho_i - r_{si})\beta' \mathbf{x}_{si}) \right)$$

Shootings

Rounds

Officers

- Inner sum has $\binom{\sum r_{si}}{n_s - 1}$ terms
- Recursive algorithm feasible up to 10^8 terms
- Can also be computed as

$$p_i \propto \exp(\beta' \mathbf{x}_{si})$$

$$\boldsymbol{\rho} \sim \text{Multinomial}(n_r - n_s, \mathbf{p})$$

$$E\left(\frac{1}{(\rho_1 + 1) \cdots (\rho_{n_s} + 1)}\right)$$

No Effect of Age

G. Ridgeway (2016). "Officer Risk Factors Associated with Police Shootings: A Matched Case-Control Study," *Statistics and Public Policy* 3(1):1-6.

Outline

- Which officers are most likely to shoot?
- Do police target black drivers?
- Are there individual officers that appear to target minorities?

Why Is Testing for Racial Profiling So Hard?

Racial Distribution of People Stopped

Difference Between

Racial Distribution of People at Risk of Being Stopped

And

= Racial Profiling

Source: Oakland Police Department, 2003

Why Is Testing for Racial Profiling So Hard?

Racial Distribution of People Stopped

Difference Between

Racial Distribution of Residents According to the Census

And

= 1.6

Source: Oakland Police Department, 2003

Source: U.S. Census, 2000

- The 1.6 disparity between the racial distributions may result from:
 - A race bias
 - Driving behavior: car ownership, time on the road, and care
 - Exposure to police by area of city, neighborhood characteristics, etc.

Does the Ability to See the Driver Influence Which Drivers Are Stopped?

- The ability to discriminate requires officers to identify the race in advance
- The ability to identify race in advance of the stop decreases as it becomes dark

J. Grogger & G. Ridgeway (2006). “Testing for Racial Profiling in Traffic Stops from Behind a Veil of Darkness,” *Journal of the American Statistical Association* 101(475):878-887

2007 ASA Outstanding Statistical Application award

Simple “Veil of Darkness” Test Shows No Evidence of Racial Bias

Simple “Veil of Darkness” Test Shows No Evidence of Racial Bias

An Approach That Involved Adjusting for “Clock Time”

Hours Since Sunset

Compare Stops During Daylight with Stops in Darkness

Hours Since Sunset

There Is No Difference in the Rate that Black Drivers Are Stopped

Hours Since Sunset

K Measures Racial Bias

$$\frac{P(S|B, V)}{P(S|\bar{B}, V)} = K_{\text{ideal}} \frac{P(S|B, \bar{V})}{P(S|\bar{B}, \bar{V})}$$

- S – Stop
- B – Black driver
- V – Race is visible
- $K_{\text{ideal}} > 1$ suggests officers are more likely to stop black drivers when their race is visible

Derivation of the VoD Estimator

$$\frac{P(S|B, t, d = 0)}{P(S|\bar{B}, t, d = 0)} = K \frac{P(S|B, t, d = 1)}{P(S|\bar{B}, t, d = 1)}$$

$$1 < K \leq K_{\text{ideal}}$$

- S – Stop
- B – Black driver
- t – Clock time
- d – Darkness
- $K > 1$ suggests officers are more likely to stop black drivers when their race is visible

Decomposition of the VoD Estimator

$$K = \frac{P(B|R, S, t, d = 0)}{1 - P(B|R, S, t, d = 0)} \frac{1 - P(B|R, S, t, d = 1)}{P(B|R, S, t, d = 1)}$$

$$\frac{P(\bar{B}|t, d = 0)}{P(B|t, d = 0)} \frac{P(B|t, d = 1)}{P(\bar{B}|t, d = 1)}$$

$$\frac{P(R|\bar{B}, S, t, d = 0)}{P(R|\bar{B}, S, t, d = 1)} \frac{P(R|B, S, t, d = 1)}{P(R|B, S, t, d = 0)}$$

VoD is Easily Implemented

- For each stop record race of driver, darkness indicator, and clock time
- Subset dataset to dates near the switch to/from Daylight Savings Time
- Logistic regression, predict race from darkness and clock time
- Report VoD estimate as $K = \exp(-\beta_1)$

Oakland 2003: $K = 0.88$

Cincinnati 2003-2008: $K = 0.96$

VoD Has Become Widely Used

- Connecticut
- San Diego
- Syracuse
- Urbana
- Minneapolis
- Raleigh-Durham
- Columbia, MO

Next wave of police departments face racial disparity analysis

By: JAKE KARA November 10, 2017

View as "Clean Read"

JAKE KARA / CTMIRROR.ORG

Kenneth Barone, beneath the screen, a project manager at Central Connecticut State University's Institute for Municipal and Regional Policy Research describes the latest traffic stop analysis.

Central Connecticut State University researchers released their third annual statewide report Thursday that identified seven Connecticut police departments for further study because of racial or ethnic disparities in their traffic stop patterns.

The departments are Berlin, Monroe, Newtown, Norwich, Ridgefield, Darien and State Police Troop B in North Canaan.

In these jurisdictions, minority drivers were more likely to be stopped during daylight hours than at night. The assumption is that it's generally easier to see a driver to determine their apparent race or ethnicity during the daytime. Applying this so-called "Veil of Darkness" analysis to Ridgefield, for example, researchers found Hispanic drivers were 2.5 times more likely to be stopped in daylight than at night.

Outline

- Which officers are most likely to shoot?
- Do police target black drivers?
- Are there individual officers that appear to target minorities?

Is an Officer Who Stops 86% Black Pedestrians Unusual?

Stop Characteristic	Example Officer (%)
	n = 392
% black pedestrians stopped	86%

- Combine three statistical techniques to answer this question
 - Propensity score weighting
 - Doubly robust estimation
 - False discovery rate

G. Ridgeway and J.M. MacDonald (2009). “Doubly Robust Internal Benchmarking and False Discovery Rates for Detecting Racial Bias in Police Stops,” *Journal of the American Statistical Association* 104:661–668

We Also Know the Exact Location of This Officer's Stops

Example Officer

Idea: Reweight Stops Made By Other Officers to Resemble This Officer's Stops

Example Officer

- Align their distributions
 $f(\mathbf{x}|t = 1) = w(\mathbf{x})f(\mathbf{x}|t = 0)$
- Solving for $w(\mathbf{x})$ yields the propensity score weight
$$w(\mathbf{x}) \propto \frac{P(t = 1|\mathbf{x})}{1 - P(t = 1|\mathbf{x})}$$
- Estimate $P(t = 1|\mathbf{x})$ using boosted logistic regression as implemented in gbm

Reweighting Aligns the Distribution of Stop Locations

Example Officer

Matched Stops

Reweighting Also Aligns the Distribution of All Other Stop Features

86% of the Officer's Stops Were
Black...

...Compared with 55% for the Benchmark

- Doubly robust benchmark estimate obtainable from weighted logistic regression

$$\ell(\boldsymbol{\beta}) = \sum_{i=1}^n w_i \left(y_i s(t_i, \mathbf{x}_i | \boldsymbol{\beta}) - \log(1 + e^{s(t_i, \mathbf{x}_i | \boldsymbol{\beta})}) \right)$$

- Disparity computed as

$$\hat{\theta}_A^{DR} = \sum_{i=1}^n t_i \left(\frac{1}{1 + \exp(-s(1, \mathbf{x}_i | \hat{\boldsymbol{\beta}})}) - \frac{1}{1 + \exp(-s(0, \mathbf{x}_i | \hat{\boldsymbol{\beta}}))} \right)$$

Repeat for Nearly 3,000 NYPD Officers Actively Involved in Stops

- $P(\text{problem}|z) = 1 - \frac{f(z|\text{no problem})f(\text{no problem})}{f(z)}$
 $\geq 1 - \frac{f_0(z)}{f(z)}$
- Right tail consists of 5 officers with “problem officer” probabilities in excess of 50%
- Standard cutoff of $z > 2.0$ flags 242 officers, 90% of which have fdr estimated to be greater than 0.999

Analysis in NYPD Flagged Five Officers

Benchmarking Can Also Flag Hospitals

G. Ridgeway, M. Nørgaard, T.B. Rasmussen, W.D. Finkle, L. Pedersen, H.E. Bøtker, and H.T. Sørensen (2019). "Benchmarking Danish Hospitals on Mortality and Readmission Rates After Cardiovascular Admission," *Clinical Epidemiology* 11:67-80

Racial Profiling, Bad Cops, and Police Shootings

Greg Ridgeway

Department of Criminology

Department of Statistics

Two Nearly Identical Officers

OIS ID	Rounds	Recruit age	Years on job	Sex	Race	Prior OIS #	Force complaints	Rank	Assign	Gun type	Caliber
2	3	24	4	Male	White	0	0	Off	Special	Pistol	9 mm
2	4	25	4	Male	White	0	0	Off	Special	Pistol	9 mm

- Identical on all features except recruit age
- Older officer shot 1.3 times more than the younger officer

Only data on officers firing one or more rounds were available

Example Shooting Only Has Information on Recruit Age

- Conditional likelihood simplifies to

$$\frac{1}{\sum_{\rho_2=1}^6 \frac{1}{(7 - \rho_2)! \rho_2!} \exp((\rho_2 - 4)\beta_{\text{RecruitAge}})}$$
